**THE MISSION**

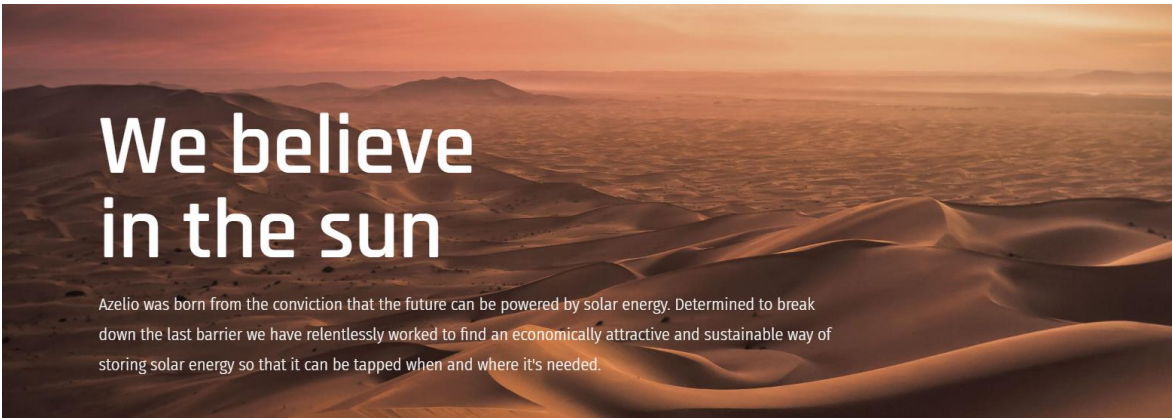

A solution to one of the world's biggest challenges

We have a solution to one of the biggest challenges facing humankind today: How to get electricity from solar power at a competitive cost even during the dark hours of the day. The key is adding an ingenious storage innovation to the highly efficient solar technology that we have already developed, making electricity from a renewable source accessible, when needed, to a low cost.

THE SOLUTION

A smarter way of storing solar energy

Our new technology for Thermal Energy Storage (TES) is applied to our proven Concentrated Solar Power (CSP) solution for electricity production. The conversion from heat into electricity is done using a specially developed and highly efficient Stirling engine. In fact, thanks to this revolutionary technology and our strategic partners we have made distributed, renewable electricity cost-competitive even to comparable fossil-based sources, for supply all hours of the day.

Azelio, offers green energy and storage solutions, and uses the sun as an energy supplier.
